PUBLIC SAFETY

The Right Way to Think Outside the Cell

The Smart-on-Crime Platform

Overcriminalization

Make your passion your profession.

From coast to coast, non-profit organizations are in need of individuals who want to become more effecitve advocates of freedom. Liberty@Work is a web-based program that combines work at public policy organizations with training that features instructors, interactive discussions, group projects, and more. Through the program, participants will join a growing network of leaders, alumni, and organizations working to advance the cause of liberty.

- Participants can be new talent identified through Liberty@Work or existing employees of our partner 501(c)(3) organizations.
- Candidates should have 0 to 10 years of work experience, a commitment to limited government, and a desire to learn.
- Job opportunities vary nationwide, including communications, policy research and analysis, legal reform, operations, program management, and donor relations.

The 10-month program starts in July 2011.
Now accepting applications.

Liberty@Work is a full-time opportunity and partipants receive a competitive wage and benefits package commensurate with experience and education from participating partner organizations.

LIBERTY@WORK a project of the CHARLES G. KOCH CHARITABLE FOUNDATION

"The coal industry and the electric power industry have a vision of the ability to use coal with near-zero emissions. And we're on a path to get there."
Dan should know. He's part of an international effort working toward the successful capture and storage of CO_2 on a large commercial scale. The technology, called carbon capture and storage (CCS), will allow us to continue using coal, one of our most abundant and affordable fuels, in an even more environmentally responsible way. And power plants using natural gas will also need to employ CCS to meet stringent CO_2-reduction goals.
As Dan is quick to point out, we are making progress toward that goal.
"We have technologies today that can capture CO_2, and we have coal-fired power plants that already capture and store CO_2 emissions. We can store carbon dioxide underground and do it in a safe way.
"I am confident, based on the number of scientists and engineers around the world working on this solution, that we can get there. That is what my job is all about."
Dan agrees that driving down the cost of capturing and storing CO_2 on a widespread basis is the next task. And with people like Dan leading the way, we will succeed.
